Calibrator

Product Specifications

December 2022 Rev. 5, 11/24 (English)

Specifications

The performance specifications describe the complete instrumental uncertainty of the Product. The specifications include stability, temperature, and humidity; within specified limits, linearity, line and load regulation, and the reference standard measurement uncertainty. The product specifications are provided at a level of confidence of 99 %, k=2.58, normally distributed. In some cases, additional specifications with a level of confidence of 95 %, k=2, normally distributed are also listed. Fluke Calibration guarantees product performance to the 99 % level of confidence.

Specifications are valid after a Product warm-up period of 30 minutes, or twice the time that the Product has been turned off.

General Specifications

Mains Power	Line Voltage (automatic selection): 100 V, 120 V, 220 V, 240 V (±10 %) Line Frequency: 47 Hz to 63 Hz
Fuse ratings	T 5A 250 V (100 V to 120 V), T 2.5 A 250 V (220 V to 240 V)
Max Power Consumption	500 VA
Environment	
Temperature	
Operating	0 °C to 50 °C
Calibration (tcal)	15 °C to 35 °C
Storage	-20 °C to +70 °C
Temperature Coefficient	Temperature coefficient for temperatures outside tcal ±5 °C is 10 % of the stated specification per °C.
Relative Humidity	
Operating	<80 % to 30 °C, <70 % to 40 °C, <40 % to 50 °C
Storage	<95 %, non-condensing. After long periods of storage at high humidity, a dry-out period (with power on) of at least one week may be required.
Altitude	
Operating	0 m to 3050 m (10 000 ft)
Non-operating	12 200 m (40 000 ft) maximum
Compliance	
Safety	IEC 61010-1: Overvoltage Category II, Pollution Degree 2; IEC 61010-2-030
Output Terminal Electrical Overload Protection	Provides reverse-power protection and immediate output disconnection on the output terminals for all functions. This protection is for applied external voltages up to ±300 V peak.
Analog Low Isolation	20 V normal operation, 400 V peak transient

Electromagnetic Compatibility (EMC)

International ..... IEC 61326-1: Controlled Electromagnetic Environment

CISPR 11: Group 1, Class A

Group 1: Equipment has intentionally generated and/or uses conductively-coupled radio frequency energy that is necessary for the internal function of the equipment itself.

Class A: Equipment is suitable for use in all establishments other than domestic and those directly connected to a low-voltage power supply network that supplies buildings used for domestic purposes. There may be potential difficulties in ensuring electromagnetic compatibility in other environments due to conducted and radiated disturbances.

Caution: This equipment is not intended for use in residential environments and may not provide adequate protection to radio reception in such environments.

Emissions that exceed the levels required by CISPR 11 can occur when the equipment is connected to a test object.

Korea (KCC) ..... Class A Equipment (Industrial Broadcasting & Communication Equipment)

Class A: Equipment meets requirements for industrial electromagnetic wave equipment and the seller or user should take notice of it. This equipment is intended for use in business environments and not to be used in homes.

USA (FCC)..... 47 CFR 15 subpart B. This product is considered an exempt device per clause 15.103.

Remote Interfaces	GPIB (IEEE-488), RS-232, USB 2.0 (TMC), Ethernet (Telnet)
Dimensions (HxWxL)	17.8 cm x 43.2 cm x 56.4 cm (7 in x 17 in x 22.2 in) Standard rack width and rack increment, plus 1.5 cm (0.6 in) for feet on bottom of Product.
Weight (without options)	22 kg (49 lb)
Range Limits	For all functions, the maximum value for each range is the range nominal. For example, the maximum output value for the 12 V dc range is 12.000 000 V.

DCV Specifications

[1] Max output capacitance of 50 pF must be considered at high frequencies and high load impedances.
[2] For compliance voltages >1 V, add 0.24 %/V to the distortion specification.
[3] For compliance voltages >1 V, add 0.6 %/V to the distortion specification.
[4] For compliance voltages >1 V, add 0.12 %/V to the distortion specification.
[5] For compliance voltages >1 V, add 1 %/V to the distortion specification.
[6] For inductive loads. For resistive loads max compliance voltage is 2 V.

Frequency Specifications

With REF CLK set to external, the frequency uncertainty is the uncertainty of the external 10 MHz clock. External reference must be a square or pulse signal with a positive peak voltage between 3 V and 5 V and frequency within ±20 µHz/Hz of 10 MHz.

Frequency Range	Resolution	1 Year Absolute Uncertainty	Jitter
0.01 Hz to 119.99 Hz	0.01 Hz	±2.5 µHz/Hz	100 ns p-p
120.0 Hz to 1199.9 Hz	0.1 Hz		
1.200 kHz to 11.999 kHz	1 Hz		
12.00 kHz to 119.99 kHz	10 Hz		
120.0 kHz to 1199.9 kHz	100 Hz		
1.200 MHz to 2.000 MHz	1 kHz		

Phase Specifications

Phase specifications apply to the phase difference between the Reference Clock and the OUTPUT and also apply to the phase difference between the main output and the axillary output.

See *Power and Dual Output Limit Specifications* for applicable dual outputs. For combinations of Voltage ≤120 mV and Current >3.1 A, phase specifications are double. For current between 3.101 A and 6 A, add 0.1 degrees.

Resistance Specifications

Continuously variable from 0 Ω to 1200 MΩ.

Applies for four-wire compensation only. For COMP OFF or two-wire COMP, add an additional amount to the floor specification as calculated by: (5 µV divided by the stimulus current in amps). For example, in two-wire mode, at 1 kΩ the floor specification within 24 hours of an ohms zero adjust for a measurement current of 1 mA is: 0.002 Ω + (5 µV / 1 mA) = (0.002 + 0.005) Ω = 0.007 Ω).

In RF fields between 2 V/m and 3 V/m from 80 MHz to 140 MHz, increase specifications by 150 %. For conducted RF voltages between 2 V and 3 V from 25 MHz to 50 MHz, increase specifications by 160 %.

Resistance Operating Characteristics

Max burden voltage of 13 V.

For currents lower than specified, the floor adder increases by Floor (new) = 2.5 x Floor (old) x Imin/Iactual. For example, a 50 µA stimulus measuring 100 Ω has a floor specification of:
2.5 x 0.001 Ω x 1 mA/50 µA = 0.05 Ω assuming an ohms zero calibration adjustment within 24 hours.

For currents higher than specified (up to max current) the specification increases to Spec(new) = Specification x (Iactual / Ispecmax)$^{0.5}$ + Floor. For example, measuring 100 Ω with a 30 mA current with 1 year 99 % confidence has a specification of 0.0030 Ω x (30 mA / 13 mA)$^{0.5}$ + Floor = 0.0046 Ω + Floor.

Capacitance Specifications

The output is continuously variable from 0 pF to 120 mF, specified range 200 pF to 120 mF.

Specifications apply to both dc charge/discharge capacitance meters and ac RCL meters. The maximum allowable peak voltage is10 V. The maximum allowable peak current is 130 mA, with an rms limitation of 30 mA at 1.2 µF and below and 70 mA above 1.2 µF.

The maximum lead resistance for no additional error in ZCOMP two-wire mode is 10 Ω..

Specifications apply for COMP OFF. For four-wire or two-wire COMP, add 15 pF for all ranges, plus 0.03 % of output for the 1.2 µF range, 0.05 % of output for the 120 µF range, 0.04 % of output for the 1.2 mF range, 0.07 % of output for the 12 mF range, and 0.21 % of output for the 120 mF range.

Inductance Specifications

The output is continuously variable from 13 µH to 120 H.

The maximum allowable peak voltage is 5 V. The maximum allowable peak current is 130 mA, with an rms limitation of 30 mA and 13 mA peak on the 120 H range.

The maximum lead resistance for no additional error in two-wire COMP mode is 2 Ω. Specifications apply for four-wire COMP. For COMP Off or two-wire COMP, add 500 µH for the 12 mH range, 400 µH for the 120 mH range, 0.4 mH and 0.04 % of output for the 1.2 H range, 0.3 mH and 0.04 % of output for the 12 H range, and 0.3 mH and 0.06 % of output for the 120 H range. Four-wire COMP required for 120 µH and 1.2 mH ranges.

DC Power Specification

Overall uncertainty in dc watts is calculated by the root sum square of the individual uncertainties of dcv and dci subject to the power and dual output limits.

$$U_{power} = \sqrt{(Uv^2 + Ui^2)}$$

AC Power Specification

Overall uncertainty in ac watts is calculated by the root sum square of the individual uncertainties of acv and aci and phase, subject to the power and dual output limits.

$$U_{power} = \sqrt{(Uv^2 + Ui^2 + U_{phase\ adder}{}^2)}$$

Where errors due to phase accuracy in % is calculated with this formula:

$$U_{phase\ adder}(\%) = 100\ (1 - \frac{Cos(\Phi + \Delta\Phi)}{Cos(\Phi)})$$

Where $\Delta\Phi$ is the phase specification.

Example: Output: 100 V, 1 A, 400 Hz, Power Factor = 0.5 (Φ =60)

Voltage Uncertainty: Uncertainty for 100 V at 400 Hz is, 150 µV/V + 0.6 mV, totaling:

100 V x 150 x 10^{-6} = 15 mV added to 0.6 mV = 15.1 mV. Expressed in percent:

15.1 mV/100 V x 100 = 0.0151 % (see *ACV Specifications*).

Current Uncertainty: Uncertainty for 1 A is 600 µA/A + 50 µA, totaling:

1 A x 600 x 10^{-6} = 600 µA added to 50 µA = 0.65 mA. Expressed in percent:

0.65 mA/1 A x 100 = 0.065 % (see *ACI Specifications*).

PF Adder: Watts Adder for PF = 0.5 (Φ =60) at 400 Hz is 0.76 % (see *Phase Specifications*).

Total Watts Output Uncertainty =

$$Total\ Watts\ Output\ Uncertainty = \sqrt{0.0151^2 + 0.065^2 + 0.76^2} = 0.76\%$$

Maximum Output Compliance Voltage: 4.5 V rms (6.4 V pk), 6.4 V dc. 120 A range maximum compliance voltage decreases from 4.5 V at 1 kHz to about 3 V at 10 kHz.

Voltage compliance developed across inductive loads may prevent range maximum current output being achieved at higher frequencies. The appropriate maximum frequency (F_{max}) for a given load inductance and current is given by:

$$Fmax = \frac{4.5}{2 \cdot \pi \cdot I \cdot L}$$

I = Current
L = Total inductance

The maximum frequency calculated with this equation is approximate. Series resistance and parallel capacitance also affect the maximum achievable frequency.

DC Offset: Magnetic remanence that follows abrupt changes in output current level may cause small changes to the dc current offset. For best results, correct for offsets in dc measurements and techniques such as dc reversal measurement results in best accuracy.
