## 配置拷贝

M300 提供配置拷贝功能（模块拷贝、通道拷贝和扩展拷贝），可用于快速将具有相同配置的通道配置至扫描列表。

按 **Config** → **编辑列表** → **拷贝**，进入配置拷贝界面。

### 1 模块拷贝：

可将一个模块（源模块）的配置复制至具有相同型号的另一个模块（目的模块）。完成模块拷贝后，源模块各通道的配置情况被自动复制至目的模块。

在配置拷贝界面中，按 **模块拷贝** 软键，打开模块拷贝界面。

- (1) 默认选中“源模块”区，使用上下方向键选择所需的源模块。
- (2) 按 **切换** 将光标切换至“目的模块”区，使用上下方向键选择所需的目的模块。
- (3) 按 **确定** 执行模块拷贝。

**注意：**所选的源模块和目的模块必须具有相同的型号，且不允许对同一模块执行拷贝操作。

### 2 通道拷贝：

可将一个通道（源通道）的配置复制至相同类型的另一个或多个通道（目的通道）。

在配置拷贝界面中，按 **通道拷贝** 软键，打开通道拷贝界面。默认将所选通道固定为源通道且选中上区域，此时，使用左右方向键选择所需的目的通道，然后按 **OK** 键选中目的通道（再次按 **OK** 键取消选中），按 **完成** 执行通道拷贝。

打开通道拷贝界面后，您也可以按 **切换**，将所选通道固定为目的通道。此时，下区域被选中，使用左右方向键选择所需的源通道，按 **完成** 执行通道拷贝。

#### 提示：

- (1) 固定所选通道为源通道时，允许选择多个目的通道。所选的目的通道显示在界面的下区域。
- (2) 固定所选通道为目的通道时，只允许选择一个源通道。
- (3) 若当前扫描列表仅有一个通道，则 **切换** 置灰禁用。

**注意：**通道拷贝，只允许同一类型通道间的拷贝，即属于同一类型模块的通道。

### 3 扩展拷贝：

可将一个模块的某一个通道（源通道）的配置复制到目的模块中与源通道类型相同的所有通道。

在配置拷贝界面中，按 **扩展拷贝** 软键，进入扩展拷贝界面。

- (1) 默认选中“源通道”区，使用方向键选择所需的源通道。
- (2) 按 **切换** 将光标切换至“目的模块”区，使用上下方向键选择所需的目的模块。
- (3) 按 **确定** 执行扩展拷贝。

**注意：** 扩展拷贝，只允许同一类型模块间的复制。该功能便于配置多个相同的测量通道。

## 通道监视

M300 通道监视功能可监视单通道、扫描列表中的多个通道或全部通道。无论当前是否处于扫描过程中，仪器对通道进行连续监视，不断从被监视通道读取读数。该功能对于在测试前排除系统故障或观测重要信号有极大作用。

通道监视功能可监视如下通道：多路复用器通道（已配置到扫描列表且 DMM 模块已打开）、多功能模块的 DIO 通道和 TOT 通道（无论是否配置到扫描列表，均可监视，且 DMM 模块不必打开）。按前面板 **Monitor** 键，您可以配置通道监视功能。

### 1 单通道监视

按 **Monitor** → **单通道**，进入单通道监视界面，默认监视扫描列表中的第一个通道。若当前没有配置扫描列表，则监视多功能模块的第 1 个通道（DIO 通道）。单通道监视功能只允许在同一时间监视一个通道。您可以随时更改被监视的通道。监视过程中，仪器仅显示但不存储读数。报警功能应用于被监视通道时，所有报警数据存储在报警队列中（仪器断电时清除数据）。欲监视多路复用器通道，需确保 DMM 模块安装并打开（**Utility** → **DMM** → “开”）且被监视的通道已加入扫描列表。允许监视未加入扫描列表的 DIO 通道和 TOT 通道。

### 2 多通道监视

按 **Monitor** → **多通道**，进入多通道监视界面。多通道监视允许监视最多 7 个通道。您可以添加或删除被监视的通道。

### 3 全通道监视

按 **Monitor** → **全通道**，进入全通道监视界面。全通道监视可以监视扫描列表中的所有通道。

To prevent potential hazards, please follow the instructions specified in this manual to use the instrument properly.

### **Use Proper Power Cord.**

Only the exclusive power cord designed for the instrument and authorized for use within the local country could be used.

### **Ground the Instrument.**

The instrument is grounded through the Protective Earth lead of the power cord. To avoid electric shock, connect the earth terminal of the power cord to the Protective Earth terminal before connecting any input or output terminals.

### **Connect the Probe Correctly.**

If a probe is used, the probe ground lead must be connected to earth ground. Do not connect the ground lead to high voltage. Improper way of connection could result in dangerous voltages being present on the connectors, controls or other surfaces of the oscilloscope and probes, which will cause potential hazards for operators.

### **Observe All Terminal Ratings.**

To avoid fire or shock hazard, observe all ratings and markers on the instrument and check your manual for more information about ratings before connecting the instrument.

### **Use Proper Overvoltage Protection.**

Ensure that no overvoltage (such as that caused by a bolt of lightning) can reach the product. Otherwise, the operator might be exposed to the danger of an electric shock.

### **Do Not Operate Without Covers.**

Do not operate the instrument with covers or panels removed.

### **Do Not Insert Anything into the Air Outlet.**

Do not insert anything into the air outlet to avoid damage to the instrument.

### **Use Proper Fuse.**

Do not touch exposed junctions and components when the unit is powered on.

### **Do Not Operate with Suspected Failures.**

If you suspect that any damage may occur to the instrument, have it inspected by

---

**RIGOL** authorized personnel before further operations. Any maintenance, adjustment or replacement especially to circuits or accessories must be performed by **RIGOL** authorized personnel.

**Provide Adequate Ventilation.**

Inadequate ventilation may cause an increase of temperature in the instrument, which would cause damage to the instrument. So please keep the instrument well ventilated and inspect the air outlet and the fan regularly.

**Do Not Operate in Wet Conditions.**

To avoid short circuit inside the instrument or electric shock, never operate the instrument in a humid environment.

**Do Not Operate in an Explosive Atmosphere.**

To avoid personal injuries or damage to the instrument, never operate the instrument in an explosive atmosphere.

**Keep Instrument Surfaces Clean and Dry.**

To avoid dust or moisture from affecting the performance of the instrument, keep the surfaces of the instrument clean and dry.

**Prevent Electrostatic Impact.**

Operate the instrument in an electrostatic discharge protective environment to avoid damage induced by static discharges. Always ground both the internal and external conductors of cables to release static before making connections.

**Use the Battery Properly.**

Do not expose the battery (if available) to high temperature or fire. Keep it out of the reach of children. Improper change of a battery (lithium battery) may cause an explosion. Use the **RIGOL** specified battery only.

**Handle with Caution.**

Please handle with care during transportation to avoid damage to keys, knobs, interfaces, and other parts on the panels.

# Power On and Inspection

## 1 Connect the power

- 1) Adjust the power voltage selector on the rear panel according to the power supply voltage. M300 supports two types of AC power inputs:  
If your supply voltage is between 115\*(100%-10%) V and 115\*(100%+10%) V, please select 115.  
If it is between 230\*(100%-10%) V and 230\*(100%+10%) V, please select 230.
- 2) Connect the instrument to AC power using the power cord provided in the accessories.

## 2 Start the instrument

Press the power key on the front panel and the instrument starts.

After the instrument starts, it checks the modules. This process would take a few seconds according to the number of modules inserted. During this process, user operation is forbidden.

## 3 Check the instrument following the steps below if the instrument does not start normally

- Check whether the power is correctly connected.
- Check whether the power key on the front panel is really on.
- Remove the power cord and check whether the voltage selector is at the correct scale and whether the power fuse is burned out. If the fuse is burned out, replace it with a specified one.

## Insert the Module into the Main Frame

Turn the main frame off; and then, insert the modules following the instructions below.

As shown in Figure 6, there is a golden circuit board edge on the top and bottom of the module. Align the two edges with the sliding chutes (as pointed out by the arrows in the figure below) in the main frame slot and push the module in until you hear a sound. At this point, interface 2 is connected to the main frame.

**Note:** For module that needs to be connected to the signal under measurement, please refer to “**Measurement Connections**” to connect the external terminal block and the signals under measurement before inserting it into the mainframe.

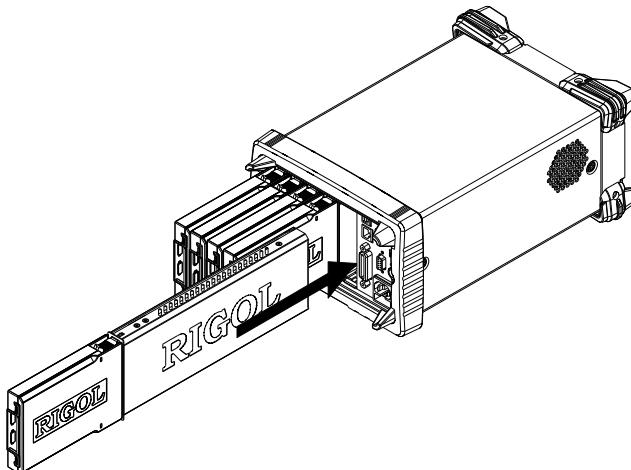

Figure 7 Insert the Module into the Main Frame

### CAUTION

All the modules of M300 do not support hot-plugging. Please turn the main frame off before inserting the modules into the main frame.

## Module Overview

### 1 MC3065 (DMM Module):

The DMM module is used to measure the signals under test and provides 6½ digit reading resolution. Its measurement functions include DCV, ACV, DCI, ACI, 2-wire resistance, 4-wire resistance, frequency, period, temperature and any sensor.

**Note:** After connecting the DMM module, make sure that the signal under test connected to the analog bus is no greater than 300 Vdc or 300 Vrms.

### 2 MC3120 and MC3120A (20-Channel Multiplexer):

All the 20 channels switch both HI and LO inputs, thus providing fully isolated signals for the DMM module. This module is divided into two banks (called A and B) with 10 two-wire channels in each bank. When making 4-wire resistance measurement, the instrument automatically pairs channels of A bank and B bank. All channels in the scan list are break-before-make. You can close multiple channels on this module only if you have not configured any channel to be part of the scan list.

This module can be connected with MC3065 (DMM Module, if MC3065 is currently inserted).

For the specifications of this module, please refer to the User's Guide or Data Sheet of this product.

### 3 MC3132 (32-Channel Multiplexer):

All the 32 channels switch both HI and LO inputs, thus providing fully isolated signals for the DMM module. MC3132 is divided into two banks (called A and B) with 16 two-wire channels in each bank. When making 4-wire resistance measurement, the instrument automatically pairs channels of A bank and B bank. All channels in the scan list are break-before-make. You can close multiple channels on this module only if you have not configured any channel to be part of the scan list.

This module can be connected with MC3065 (DMM Module, if MC3065 is currently inserted).

For the specifications of this module, please refer to the User Guide or Data Sheet of this product.

### 4 MC3164 (64-Channel Single-Ended Multiplexer):

All the 64 channels can only switch HI input. MC3164 is divided into two banks (A and B) with 32 single-ended channels in each bank. All channels in the scan list are break-before-make. In any case, you cannot close multiple channels on this module.

This module can be connected with MC3065 (DMM Module, if MC3065 is currently inserted) but cannot be used for 4-wire resistance measurement.

For the specifications of this module, please refer to the User's Guide or Data Sheet of this product.

## 5 MC3324 (24-Channel Multiplexer):

All the 20 voltage channels switch both HI and LO inputs, thus providing fully isolated inputs for the DMM module. The 20 voltage channels are divided into two banks (called A and B) with 10 two-wire channels in each bank. When making 4-wire resistance measurement, the instrument automatically pairs channels of A bank and B bank. All channels in the scan list are break-before-make<sup>[1]</sup>. You can close multiple channels on this module only if you have not configured any channel to be part of the scan list.

The 4 current channels are used in combination with the DMM module to perform DC current or AC current measurement. All channels in the scan list are break-before-make<sup>[1]</sup>. In any case, you cannot close multiple channels on this module.

This module can be connected with MC3065 (DMM Module, if MC3065 is currently inserted).

For the specifications of this module, please refer to the User's Guide or Data Sheet of this product.

**Note** <sup>[1]</sup>: *break-before-make* means that only one channel can be closed at each time. For voltage channels (channel 1 to channel 20), it is always to open the connection between the channel and the DMM module before closing the connection between the next channel and the DMM module during a scan. For current channels (channel 21 to channel 24), the following operations are performed during a scan: to close the short relay of the channel, to open the connection between the channel and the DMM module, to close the connection between the next channel and the DMM module and to open the short relay of the next channel.

## 6 MC3416 (16-Channel Actuator):

MC3416 can connect signal to the device under test or enable external device. Any of the 16 channels can switch to Normally-Open (NO) and Normally-Closed (NC) states.

For the specifications of this module, please refer to the User's Guide or Data Sheet of this product.

## 7 MC3534 (Multifunction Module):

It provides 3 kinds of functions with 4 channels for each function. This module can be used to check status or control external device (such as the solenoid, power relay and microwave switch). You can also read the digital inputs and the totalizer count during a scan.

- Four 8-bit digital input/output (DIO) ports
- 4 totalizer (TOT) input terminals (the first two channels are 10 MHz TOT and the other two channels are 100 kHz TOT) with 1 Vpp sensitivity
- 4 analog output terminals, ±12 V calibrated voltage

For the specifications of this module, please refer to the User's Guide or Data Sheet of this product.

## 8 MC3648 (4x8 Matrix Switch):

MC3648 is used to connect multiple devices to multiple points on the device

under test. You can connect the rows and columns of multiple matrix switches to form relatively larger matrix (such as 8×8 and 4×16, the number of crosspoints cannot exceed 160).

32 two-wire crosspoints which can connect any combination of inputs and outputs at the same time. For the specifications of this module, please refer to the User's Guide or Data Sheet of this product.

## 9 MC3724 (Dual 4-Channel RF Multiplexer)

MC3724 provides two independent banks of 4-channel RF multiplexers and can be used to switch high frequency pulse signals.

- The channels in each bank have a common earth ground (the outer layer of the SMB connectors is grounded).
- Only one channel in each bank may be closed at a time.
- You can connect your signals directly to the on-board SMB connectors (2 GHz bandwidth) or to the SMB-to-BNC cables (1 GHz bandwidth) provided with the module.
- You can cascade multiple RF multiplexers to create larger RF multiplexer.

# Basic Operations

This section introduces the basic operations of M300, including how to connect the signals to be measured, how to configure the scan list as well as how to control the instrument remotely.

## Measurement Connections

Multiple signals to be measured are connected to the plug-in modules through the external terminal blocks and then are switched to the DMM module or external DMM. M300 provides 9 kinds of terminal blocks. The models of the terminal blocks and their corresponding modules are listed in the table below. This section introduces how to connect the signals to be measured through the external blocks.

**Note:** For MC3724, there is no terminal block. You can connect your signals directly to the on-board SMB connectors or to the SMB-to-BNC cables provided with the module.

### WARNING

Cut off all the power supplies before opening the terminal block or removing the terminal block from the module.

- 1 Place the terminal block with the front (with the **RIGOL** caption) facing downward and pull the two latches in the arrow direction in the figure below and press them down. Place the terminal block with the front facing upward and pull the upper cover of the terminal block upward and remove it.

- 2 Connect the cables for connecting the signal under test according to the labels on the circuit board of the terminal block (for the connecting method, refer to Table 2). Pass the binding wires through the two groups of holes as pointed out by the arrows in the figure below to fix the cable connected. Pay attention to the channel or terminal connected to the cable to ensure that the signal connected is correct.

**Note:**

- For the connection method of each module and the corresponding terminal block as well as the specification requirements of the connecting cable, please log in **RIGOL** official website ([www.rigol.com](http://www.rigol.com)) get more related

materials.

- When using the multiplexer module for measurement, make sure that both the amplitude of the signal under measurement and the common mode voltage are no greater than the maximum input voltage of the module.
- When the multiplexer module is used to measure an object with high-power output ability (such as battery and power supply), to avoid damaging the relay, you are recommended to connect a fuse in serial when making connections (as shown in the figure below).

- 3 Connect the terminal block to interface 1 (the interface definition is in Figure 6) on the module, screw down the two screw rods to fix them onto the nuts on the module.

- 4 Close the upper cover of the terminal block.

- 5 Insert the module connected with the terminal block into the slot of the main frame.

After opening the channel copy interface, you also can press **Switch** to fix the channel selected as the target channel. At this point, the lower area is selected. Use the left/right arrow key to select the desired source channel and press **Done** to execute channel copy.

### Tips:

- (1) When the channel selected is fixed as the source channel, multiple target channels can be selected and will be displayed in the lower area.
- (2) When the channel selected is fixed as the target channel, only a single source channel can be selected.
- (3) **Switch** is grayed out and disabled if the current scan list only has a single

channel.

**Note:** For channel copy, only copies between channels of the same type (namely, channels of the same type of modules) are allowed.

### 3 Extended Copy:

Copy the configuration of a channel (source channel) of a module to all the channels (of which the type is the same to that of the source channel) of the target module.

Press **Extended** in the configuration copy interface to open the extended copy interface.

- (1) The "Source Channel" area is selected by default. Use the arrow keys to select the desired source channel.
- (2) Press **Switch** to move the cursor to the "Target Module" area and use the up/down arrow key to select the desired target module.
- (3) Press **OK** to execute extended copy.

**Note:** For extended copy, only copies among the same type of modules are allowed. This function makes it easy to configure several channels with the same configurations.

## Channel Monitor

The channel monitor function of M300 allows users to monitor a single channel, multiple channels or all of the channels in the scan list. The instrument monitors the channel and takes readings from the channel monitored continuously even during a scan. This function is helpful for troubleshooting your system before a test or for observing important signals.

The channel monitor function can monitor the following channels: multiplexer channels (configured to the scan list and the DMM module is enabled), DIO and TOT channels of the multifunction module (no matter whether they are configured to the scan list and the DMM module is not required). Press **Monitor** on the front panel to configure the channel monitor function.

### 1 Single-channel Monitor

Press **Monitor** → **Single** to enter the single-channel monitor interface. By default, the first channel in the scan list is monitored. If no scan list is currently configured, the first channel of the multifunction module (DIO channel) is monitored. Only a single channel can be monitored at a time; but you can change the channel being monitored at any time. Readings acquired during the monitor process are displayed on the screen but will not be stored in memory. When the alarm function is applied to the channel being monitored, all the alarm

data will be stored in the alarm queue (the data will be cleared at power-off). To monitor a multiplexer channel, the DMM module must be installed and enabled (**Utility** → **DMM** → “ON”); the channel to be monitored must be configured to the scan list. You can monitor a DIO or TOT channel even if the channel is not configured to the scan list.

## 2 Multi-channel Monitor

Press **Monitor** → **Multiple** to enter the multi-channel monitor interface. At most 7 channels can be monitored. You can add or delete the channels being monitored.

## 3 All Channel Monitor

Press **Monitor** → **All Moni** to enter the all channel monitor interface. All the channels in the scan list can be monitored.

# Remote Control

M300 can communicate with PC through USB, LAN, GPIB and RS232 (converted from the **[RS-232/Alarms/Ext Trig]** interface on the rear panel of M300) to realize remote control based on the SCPI (Standard Commands for Programmable Instruments) commands. This section introduces how to use the PC software **Ultra Sigma** of **RIGOL** to control the instrument remotely through the USB interface. For the detailed information about the SCPI commands, please refer to the Programming Guide.

## 1 Install Ultra Sigma

Download Ultra Sigma from **RIGOL** website ([www.rigol.com](http://www.rigol.com)) and install it according to the instructions.

## 2 Control the instrument via USB

### (1) Connect the devices

Connect the USB Device interface of M300 to the USB Host interface of your computer using a USB cable.

### (2) Install the USB driver

As this instrument is a USB-TMC device, after you connect it to the PC and turn both on for the first time, Found New Hardware Wizard is displayed on the PC. Please install the “USB Test and Measurement Device (IVI)” driver following the directions in the wizard.

### (3) Search for device resources

Start up **Ultra Sigma** and the software will automatically search for the instrument resources currently connected to the PC. You can also click **USB-TMC** to search for the resources.

### (4) View the device resource

The resources found will appear under the “RIGOL Online Resource”

directory and the model number and USB interface information of the instrument will also be displayed as shown in the figure below.

Figure 9 View USB Instrument Resource

## (5) Send Command/Read Data

Right click the resource name "M300

(USB0::0x1AB1::0x0C80::M300123123123::INSTR))" and select "SCPI Panel Control" to turn on the remote command control panel through which you can send commands and read data.

**Note:** When the instrument is in remote mode, **Rmt** is displayed in the status bar in the user interface and all the keys on the front panel (except ) are locked. At this point, you can press to exit the remote mode.

# Troubleshooting

When the failures listed below occur, please solve them according to the following steps. If the problem persists, please contact **RIGOL** and provide the system information of your instrument (**Utility** → **Info**).

## 1 The instrument does not start.

- 1) Check whether the power cord is correctly connected.
- 2) Check whether the power switch on the front panel is really on.
- 3) Remove the power cord; check whether the voltage selector is at the proper scale and whether the power input fuse is burned out. If the fuse is burned out, replace it with a specified one.
- 4) Restart the instrument after executing the above inspections.
- 5) If the problem persists, please contact **RIGOL**.

## 2 The USB storage device cannot be recognized.

- 1) Check whether the USB storage device can work normally.
- 2) Make sure the USB storage device used is FAT32 format and Flash type.
- 3) Restart the instrument and insert the USB storage device to check it.
- 4) If the USB storage device still cannot work normally, please contact **RIGOL**.

## 3 How do I recover the configurations from the last power failure or unexpected shutdown and continue the work before the shutdown automatically?

Restart the instrument. Press **Utility** → **System**, select **Power-off** using the up/down arrow key and select "ON" using the left/right arrow key.

## 4 The screen is too dark.

Press **Utility** → **System**, select **Brightness** using the up/down arrow key and set a proper brightness using the left/right arrow key.

## 5 The instrument is locked.

- 1) Check whether the instrument is in remote mode (namely check whether "Rmt" is displayed in the status bar in the user interface). If yes, you can press  to exit the remote mode and unlock the front panel.
- 2) Check whether the front panel of the instrument is locked (namely check whether  is displayed in the status bar in the user interface). If yes, you can press and hold  to unlock the front panel.
- 3) Check whether a progress bar is displayed in the interface. If yes, please wait and try again until the progress bar disappears.
- 4) If the problem persists, please restart the instrument.

## 6 How do I change the system language?

Press **Utility** → **System**, select **Language** using the up/down arrow key and

select the desired language using the left/right arrow key.

**7 How do I view the information and model number of the plug-in modules?**

Press **Utility** → **Test**; select the desired module using the left/right arrow key and press **View** to view the information and model number of the module currently selected.

**8 The corresponding indicator on the front panel does not go on when the module has been inserted.**

- 1) Press **Utility** → **Test**; select the desired module using the left/right arrow key and press **Re-test**.
- 2) If the problem persists, press **View**. If the information of the module cannot be viewed, please refer to the failure 9.
- 3) If the information of the module can be viewed, the module indicator is possibly damaged. Please contact **RIGOL** for maintenance information.

**9 I cannot view the information of the module or use the module when the module has been inserted.**

- 1) Turn the main frame off and remove the module from the main frame; insert the module into the mainframe again firmly.
- 2) Restart the main frame, wait for about 1 minute and try to view the module information again.
- 3) If the problem persists, please contact **RIGOL**.

**10 I cannot make configurations or operations related to the DMM module when it has been inserted.**

- 1) Make sure that **Utility** → **System** → **DMM** is set "ON".
- 2) Press **Utility** → **Test**; select the DMM module using the left/right arrow key and press **View** to view whether the information of the DMM module is normal. If the information is not displayed or is not displayed correctly, it is possibly that the DMM module is working abnormally due to high current or power load failure. At this point, please turn the main frame off and restart it a few minutes later.
- 3) If the problem persists, please contact **RIGOL**.

**11 The GPIB interface cannot work normally.**

- 1) Check whether the cable works normally and the connection is correct and reliable.
- 2) Make sure that the GPIB addresses of M300 and the PC are identical.
- 3) If the problem persists, please contact **RIGOL**.

**12 The USB Device interface cannot work normally.**

- 1) Check whether the cable works normally and the connection is correct and

reliable.

- 2) Check whether the "USB Test and Measurement Device (IVI)" drive program has been correctly installed on your PC.

### **13 The RS232 interface cannot work normally.**

- 1) Make sure that the RS232 interface parameters (such as the baud rate) settings of M300 and the PC are identical.
- 2) Check whether the RS232 cable is a cross cable.
- 3) If the problem persists, please contact **RIGOL**.

### **14 The LAN interface cannot work normally.**

- 1) Check whether the cable works normally and the connection is correct and reliable.
- 2) Check the IP configuration mode:
  - If DHCP is enabled, please make sure that the current network supports DHCP configuration mode and can distribute network parameters (such as the IP address) to M300 automatically.
  - If DHCP is disabled and Auto IP is enabled, please check whether the IP addresses automatically acquired by M300 and the network parameters of the PC are in the same network segment.
  - If only Manual IP is enabled, please make sure that the network parameter settings of M300 and the PC are in the same network segment.
- 3) If the problem persists, please contact **RIGOL**.
