Details

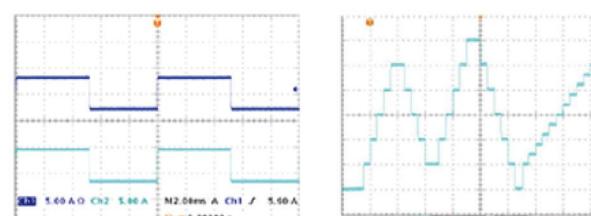

PEL-9150S series electronic load is a special precision instrument used to simulate the load change of low-voltage and high-power products. It can be applied to load simulation of high-power switching power supply, power supply equipment, power battery pack and electronic component test. The multiple functions of this series of products provide a complete solution for testing high-power power supply and electronic products.

PEL-9150S series electronic load has multiple models to facilitate engineers and technicians to select the most suitable load equipment. The load power is from 1.2KW to 40KW, the load current is up to 1500A, and the working voltage is 0-150v, which can be used for testing various low-voltage and high-power electronic products.

PEL-9150S series load provides four static loading modes: constant current mode (CC) and constant resistance mode (CR) are applicable to load simulation of traditional switching power supply, constant voltage mode (CV) is applicable to load simulation of battery charger and constant current output power supply, and constant power mode (CP) can be used as load simulation of power battery pack and energy storage device.

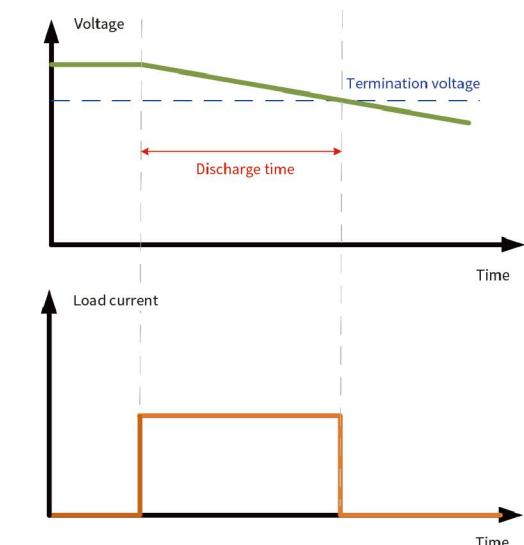

PEL-9150S series electronic load can not only simulate high-speed dynamic load changes with a frequency of up to 20KHz, but also simulate more stringent dynamic load changes, such as ladder load changes, pulse load changes, etc. It can also test the load characteristics of the tested products.

PEL-9150S series electronic load has 1000 sets of data storage capacity, and can be programmed to automatically run multiple sets of load switching. With 16-bit A/D conversion chip, it has high-precision voltage and current detection, and all data are displayed on the 5" TFT color screen. RS-232C interface is equipped as standard, and GPIB remote control interface is optional to facilitate system integration.

PEL-9150S series electronic load can also be used to simulate the discharge of power battery. Set the size of the battery discharge load and use the constant power (CP) load mode to simulate the battery discharge characteristics. The cut-off discharge voltage of the battery is measured through the accurate measurement circuit, and the time required for the battery to discharge to the cut-off voltage point is calculated.

PEL-9150S series electronic load provides software calibration function, making daily maintenance easier. It also has OP, OV, OC, OT and positive-negative reverse alarm functions to ensure more stable and safe operation of the product. It is a reliable product for engineering test and automatic test system integration.

High precision Power Meter

MPM-1010/1010B

MPM-1010 high-precision power meter applies direct plug mode instead of traditional terminal posts according to customers suggestion, to improve safety and convenience. The voltage and current sampling section uses precision resistance direct sampling instead of traditional transformer sampling, which ensures the original data is undistorted and improves the accuracy of the instrument. And this machine is especially adapted to some half wave and other various waveform measurement of DC component, testing full wave resistance, the distorted wave, half wave, symmetrical and unsymmetrical square wave, triangle wave, sawtooth wave and other special waveform under AC mode. It is a high cost-effective product with novel appearance and scientific design. It is widely used in mobile phone charger, adapter, switch power, household appliance, transformer and other industries.

Oscilloscope Probe

Essentially, an oscilloscope probe establishes a physical and electrical connection between a test point or source and an oscilloscope; in fact, an oscilloscope probe is a type of device or network that connects a signal source to an oscilloscope input. There are three key issues with the degree of connectivity: physical connectivity, impact on circuit operation, and signal transmission.
